Cue-locked population responses across the recorded network

Odd trials define normalization and row order; held-out even trials supply the displayed activity.

80 trials | 40 odd / 40 even | -1 to +5 s | neuron-mean traces with SEM

Heatmap colors are clipped at -2 to +4 z. Ribbons are SEM across recorded neurons, not animals.

All four views use the same rate limits and color scale; All pools the three recording areas.
