c

Cue-response timing by waveform class and area

Six population traces | one point per cue-modulated neuron | descriptive plots

S1 M1 M2

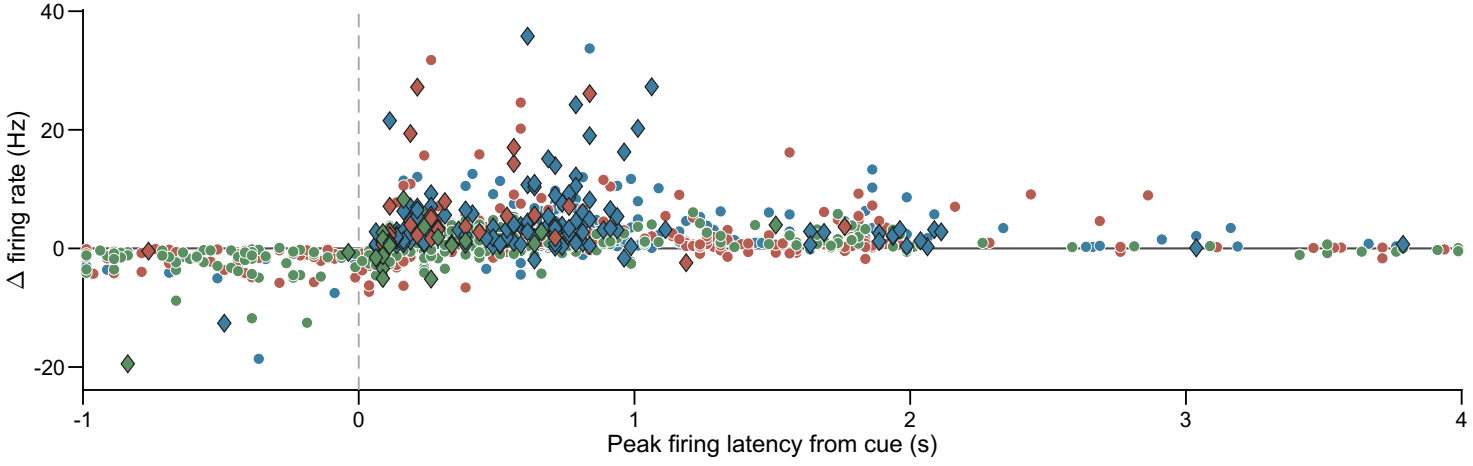

Mean firing rate over cue-relative latency

Lower traces are reflected below zero for display; tick labels give the actual positive rate.

Firing-rate change versus peak latency

Circles: regular Diamonds: fast

Delta rate = mean 0-3 s rate - mean -5-0 s rate. Points retain their measured sign and latency.

Lines: neuron-mean PSTH, 50-ms Gaussian smoothing. No statistical comparisons are displayed.
