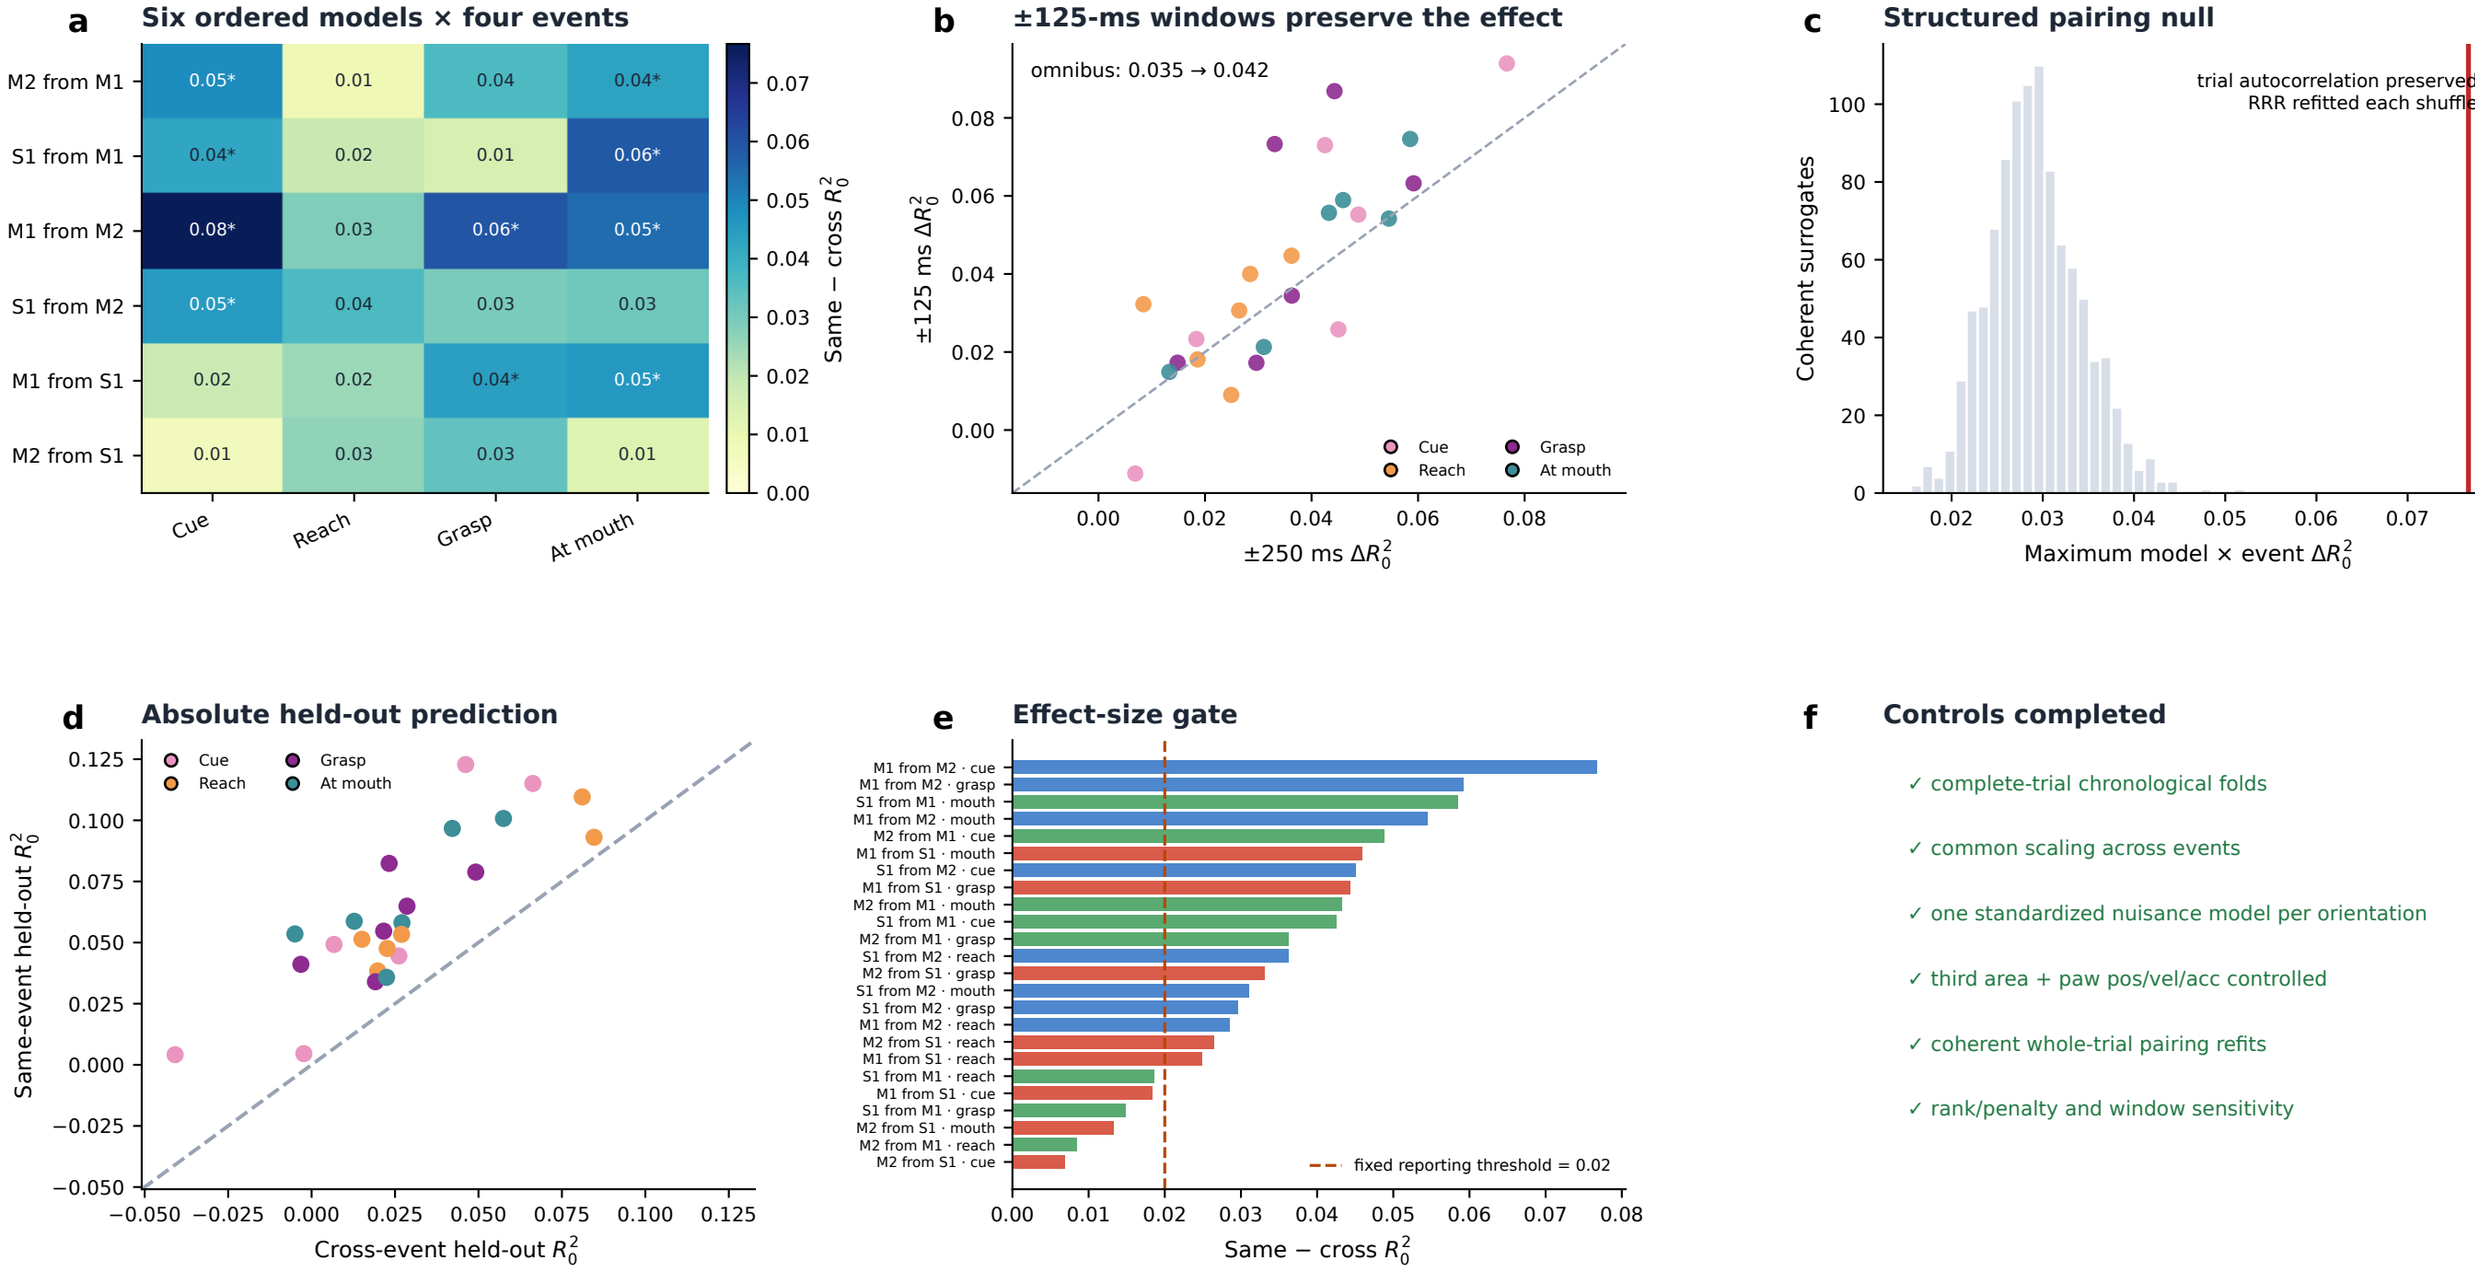
Figure 5 | Movement-event specificity remains under narrower-window, model-choice, unit-count and pairing controls



Primary supplied project-QC cohort: 705 units, common-event n=63; strict paw-quality n=61. The independent 603-unit derived strict cohort and matched-unit draws remain positive. Asterisks denote coherent whole-trial max-T P<0.05 across 24 ordered-model×event tests. One mouse/day.
