a

Native static observation model learned from all 1,346 neurons

Selected seed 760 · 38 factors · learned W and b · exponential output link · no post-hoc test calibration

$$\log \lambda_n(t) = b_n + \sum_{k=1}^{38} W_{nk} f_k(t)$$

STATIC READOUT
The same W and b apply at every event

EXACT FORWARD IDENTITY
native log rate = Wf+b audited before export

BOUNDARY
Model coefficients are not synapses or causality
