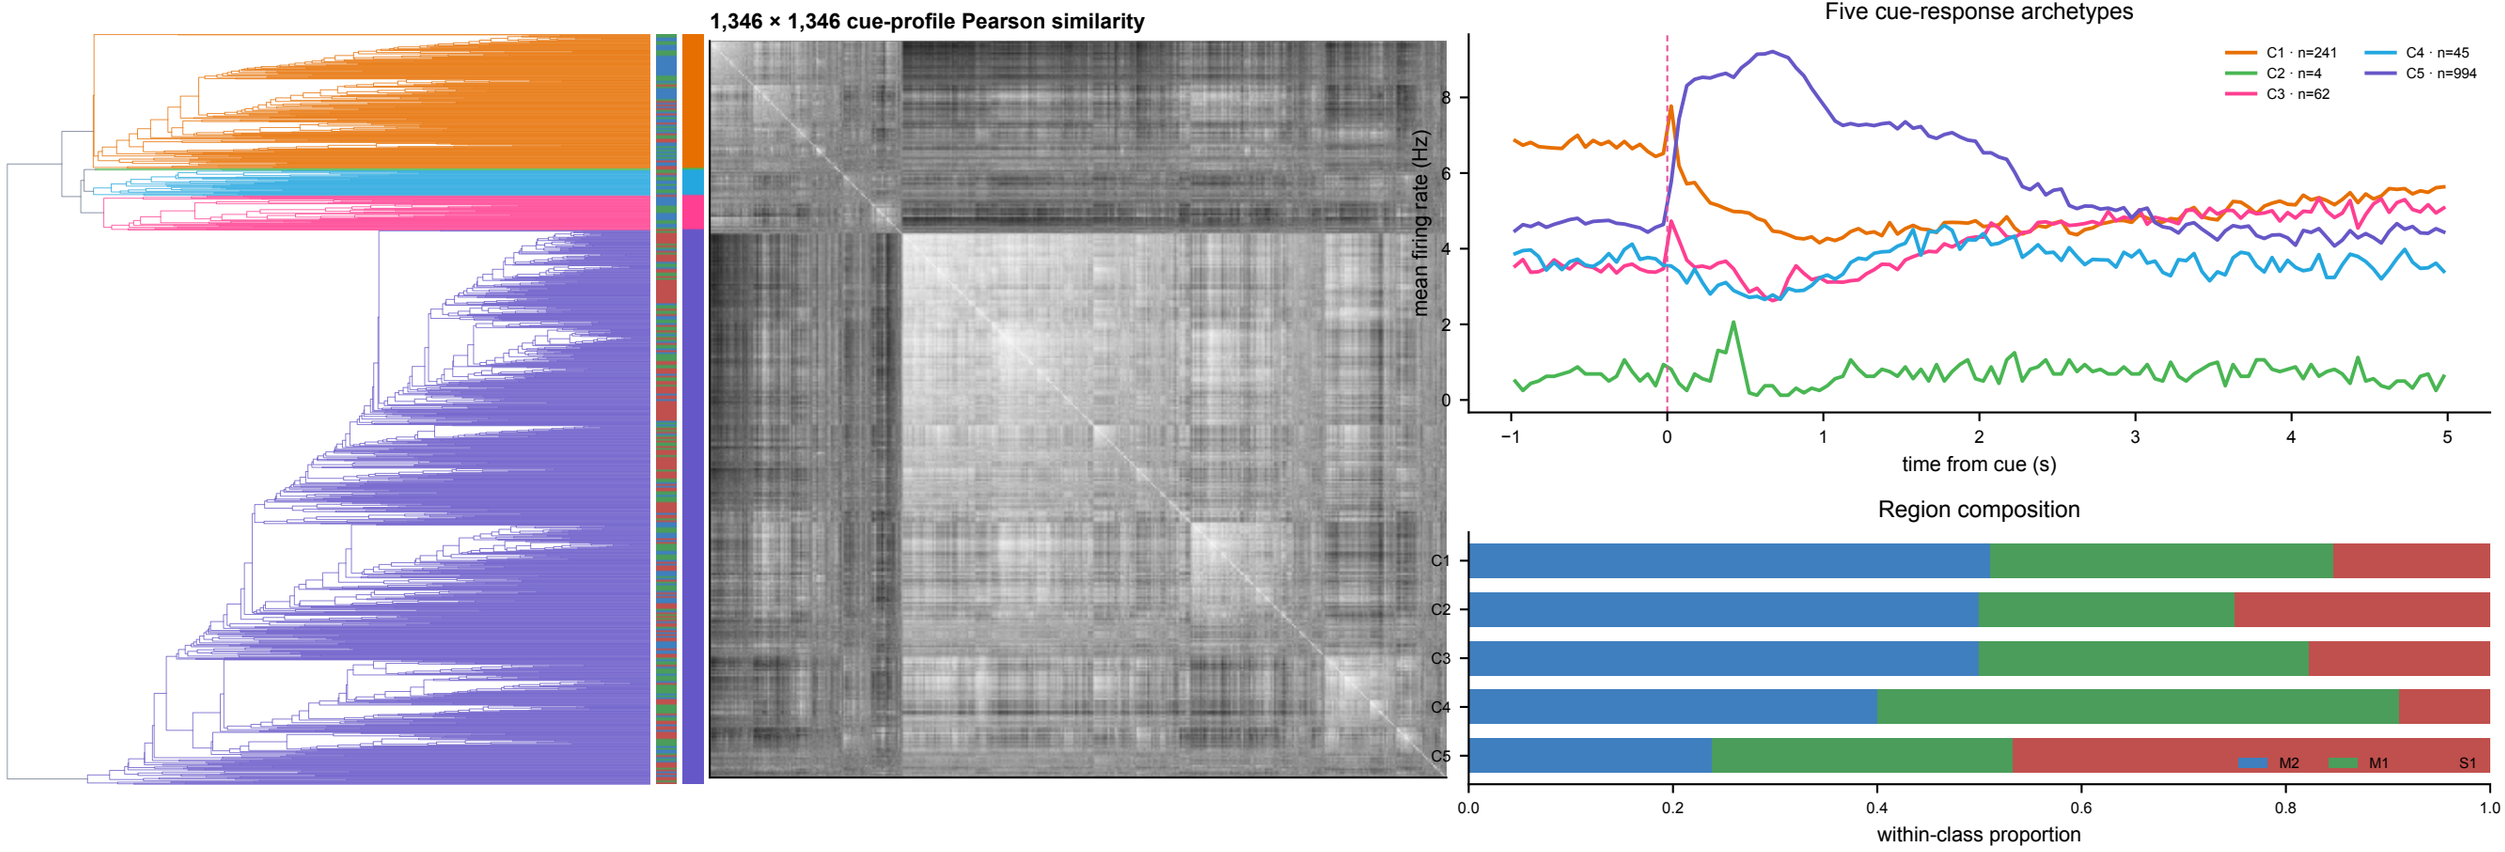

Figure 4a | Major cue-response hierarchy and regional composition

Average-linkage clustering, the full similarity matrix and five response-class summaries are shown at full width.

a

Average-linkage clustering uses trial-mean cue profiles and preserves the original leaf order. Region and response-class strips align with the full 1,346 × 1,346 Pearson-similarity matrix. Class traces and regional compositions summarize the same five descriptive response motifs; they are not validated cell types.
