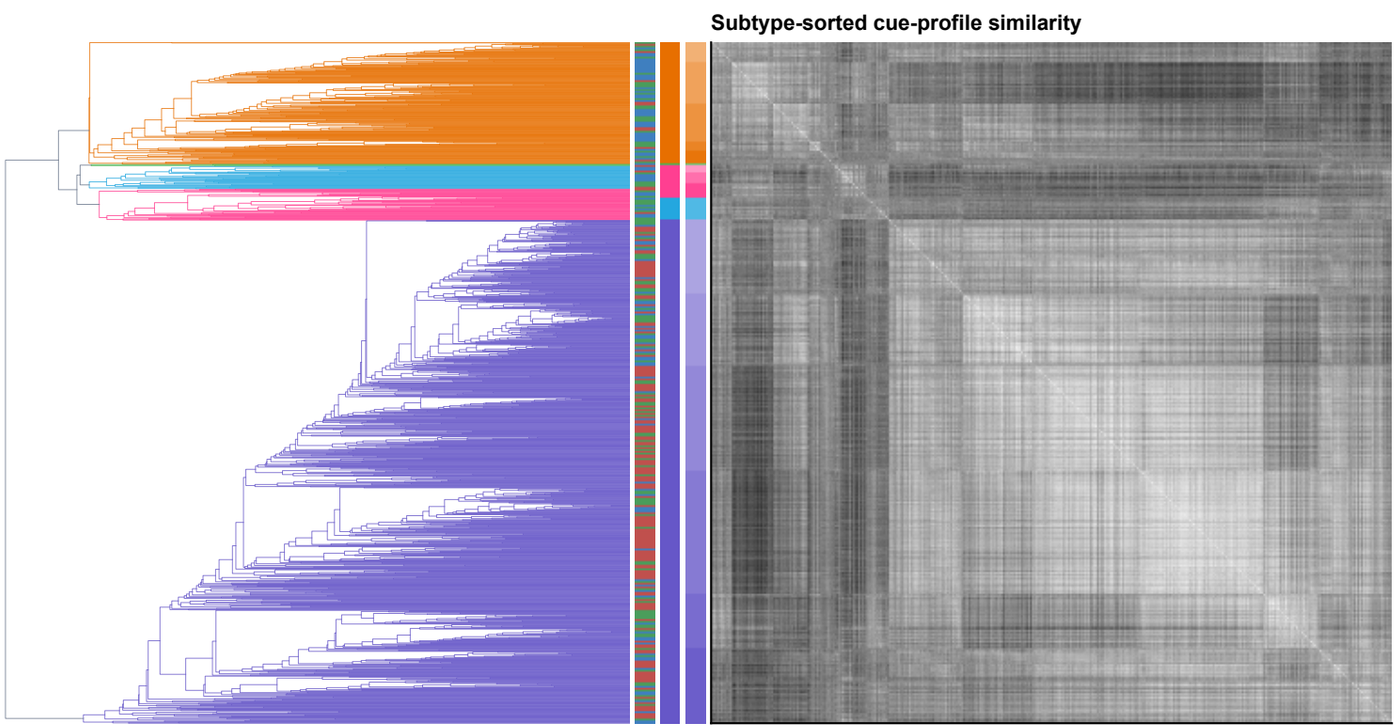

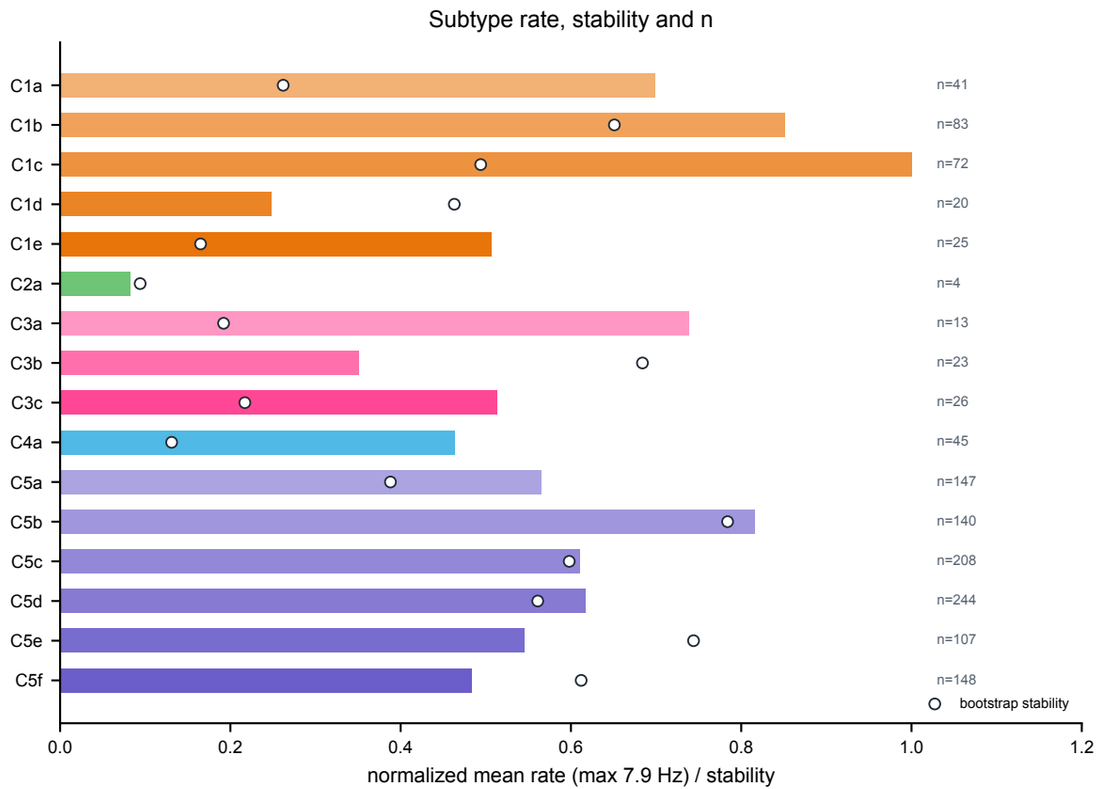

Figure 4b | Sixteen descriptive cue-response subtypes

Subtype ordering, similarity structure, mean rate, sample size and end-to-end bootstrap stability are displayed together.

b

The original 16-subtype order is retained across the dendrogram, region/class/subtype strips and subtype-sorted similarity matrix. Bars show normalized subtype mean rate, circles show end-to-end bootstrap stability and labels report n. The four-cluster C2 subtype remains visibly fragile; subtype labels are descriptive motifs rather than cell types.
