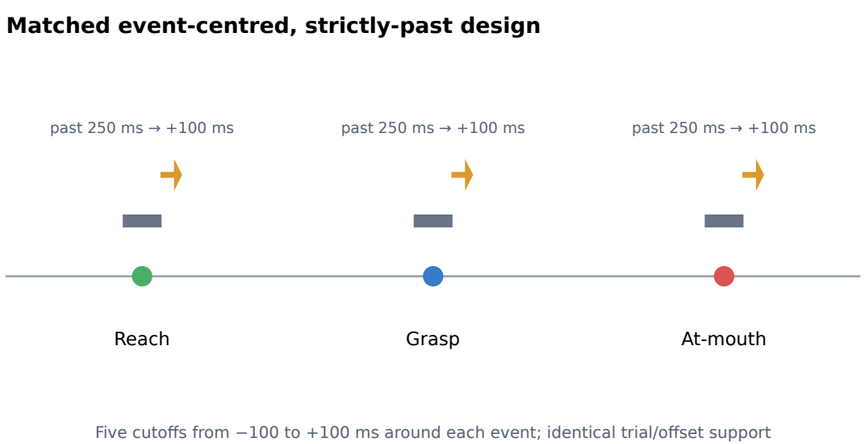
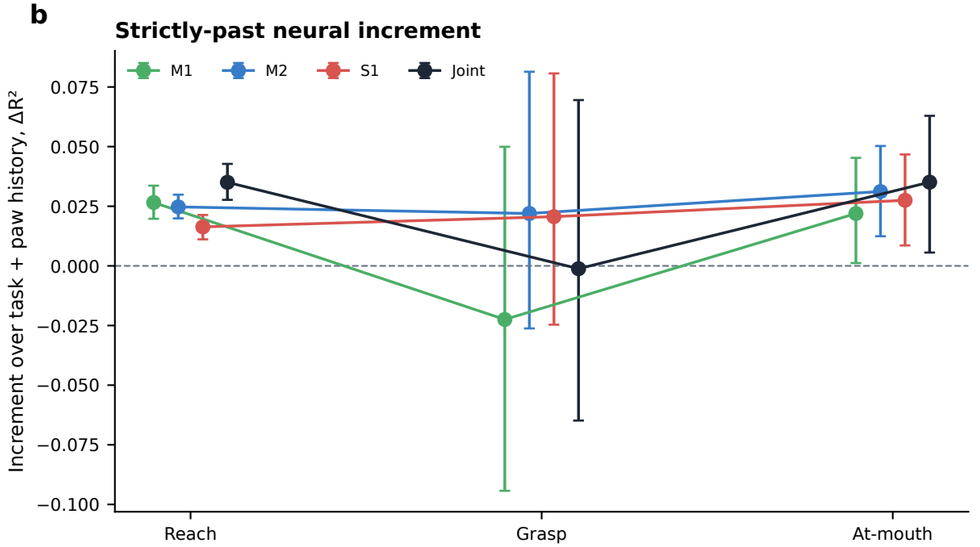
# Event-stratified prospective paw prediction

Frozen Figure 9 outer-held-out predictions were sliced at matched reach, grasp and at-mouth windows without refitting one mouse-day · 61 trials · 302 matched trial-offset keys/event

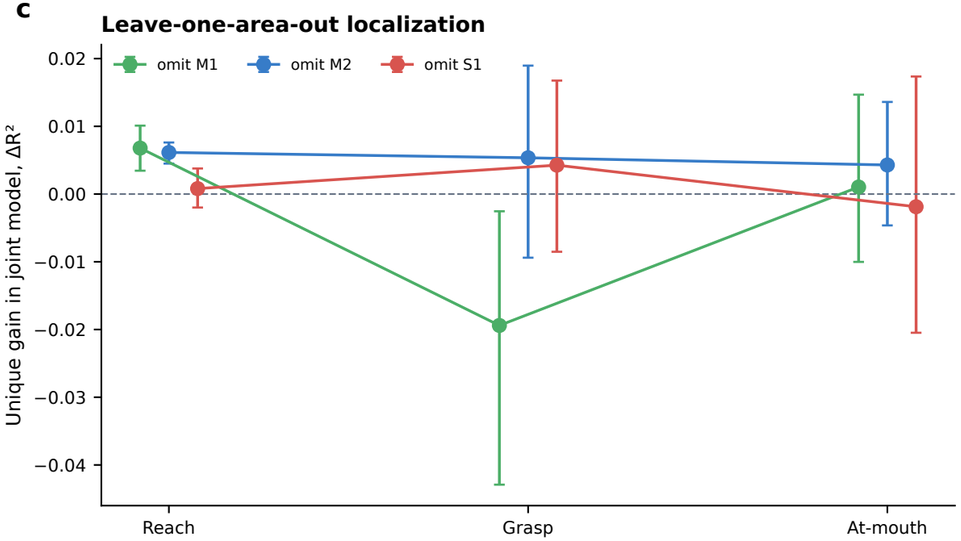
**a**



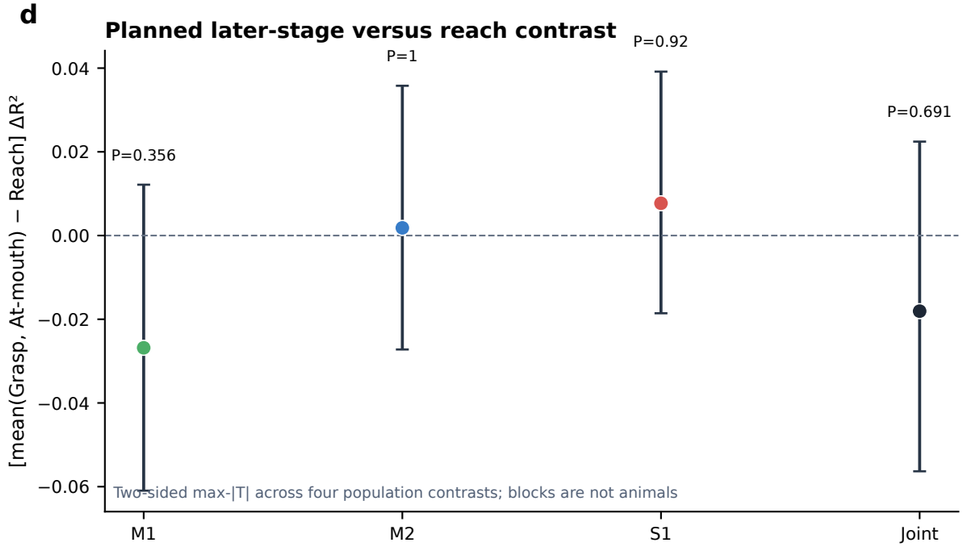
**b**



**c**



**d**



Interpretation boundary: event-stratified held-out prediction can localize when prospective information is strongest, but cannot identify motor command, sensory feedback, causal routing or physiological direction; camera–neural synchronization was not independently verified.
