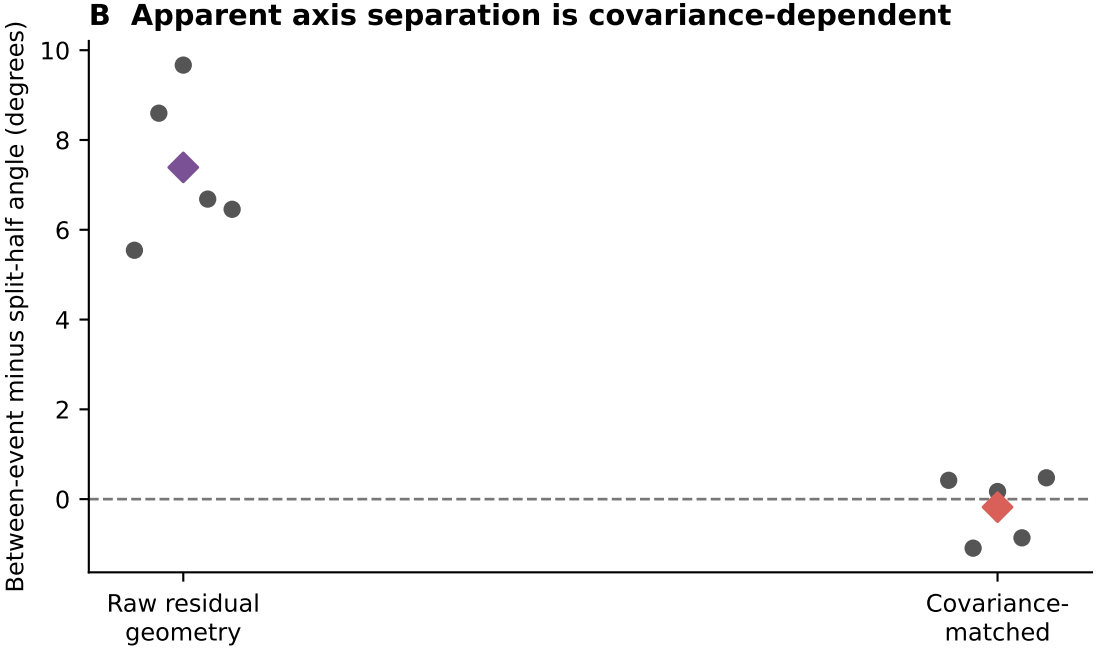
Adjudicating event specificity: stable transfer effect, no robust axis rotation, small gated-dynamics gain

A What did the controls adjudicate?

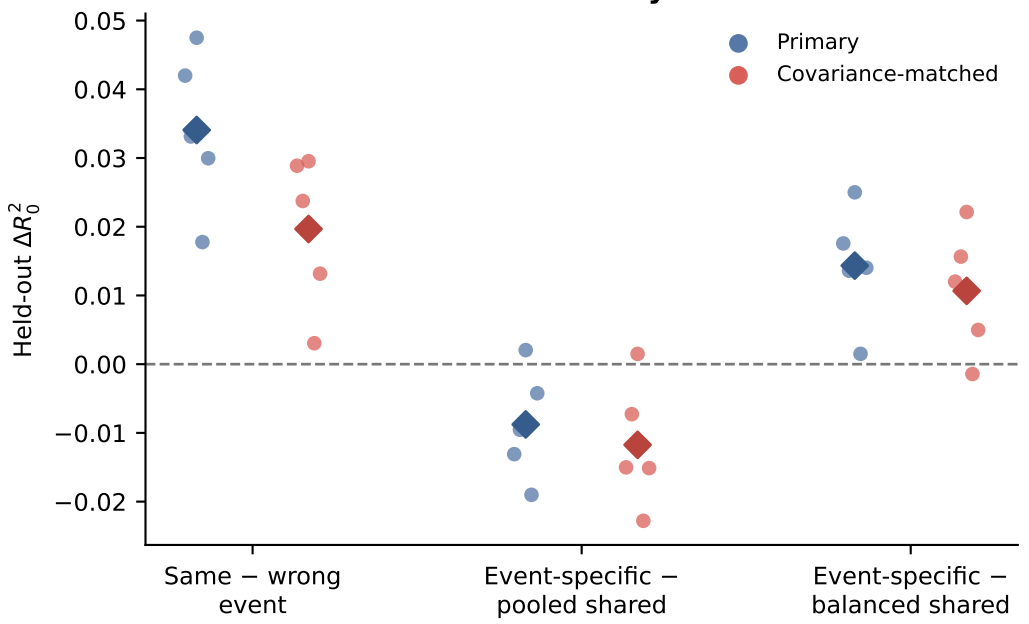
Same-event > wrong-event transfer	YES
Event-specific > pooled shared map	NO
Angle gap after covariance matching	NO

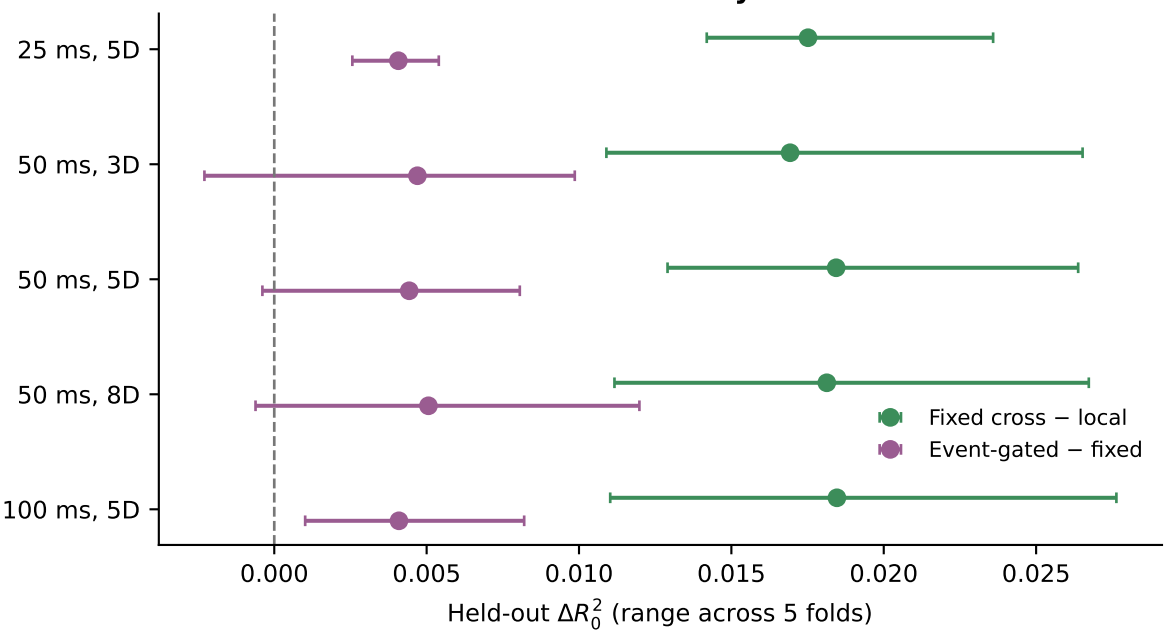
Conclusion: predictive non-exchangeability without evidence that fitted axes truly rotate.

B Apparent axis separation is covariance-dependent



C Transfer and model-necessity are different tests





D Recurrent architecture sensitivity
