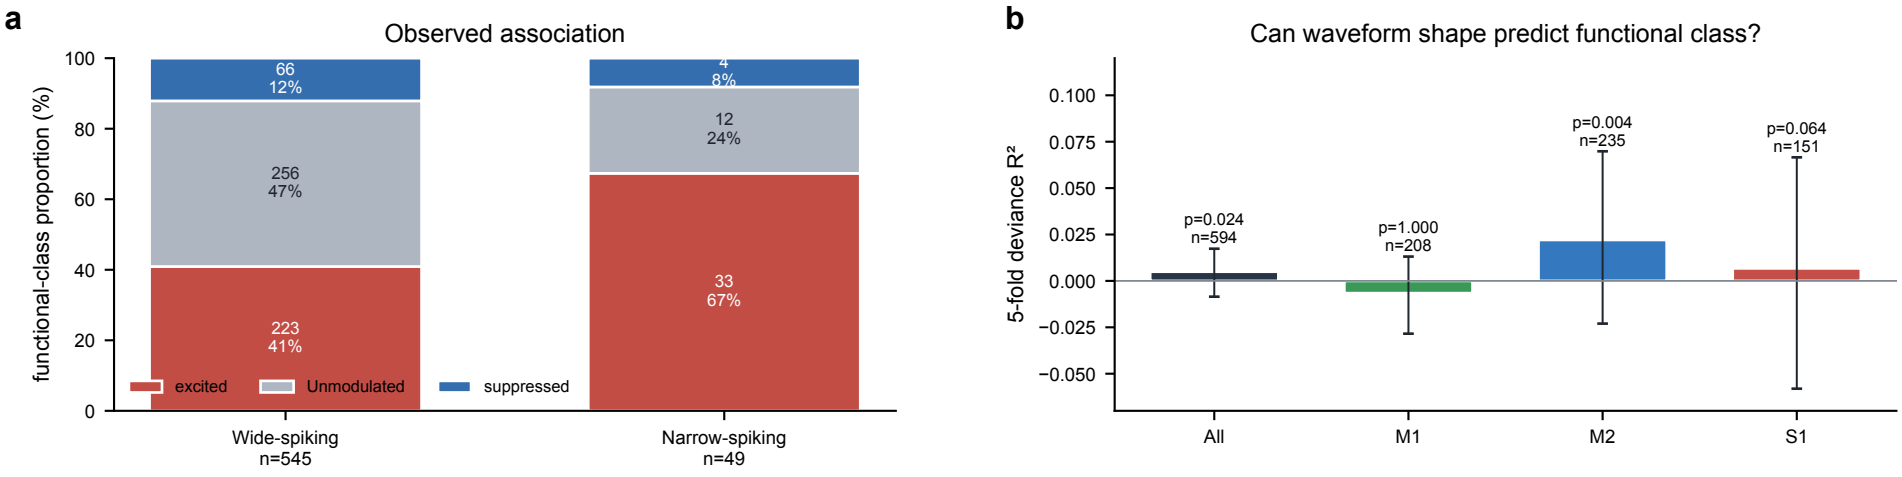
Extended Data Figure 2c | Waveform-functional association is small and area-dependent



a, Functional response proportions for unambiguous wide- and narrow-spiking classes. b, Five-fold out-of-fold multinomial deviance R^2 uses trough-to-peak duration and post-peak/trough ratio; the All model adjusts its null for cortical area. Error bars are unit-bootstrap 95% intervals and p values are label permutations within area. Deviance R^2 is used because functional class is categorical; ordinary least-squares R^2 would be invalid.
