Extended Data Figure 7a | Full-trial functional hierarchies preserve trial identity

The raw and normalized 25-s hierarchies are shown separately because they answer different similarity questions.

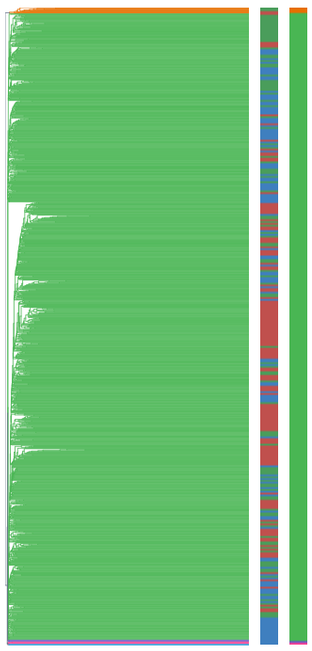

e

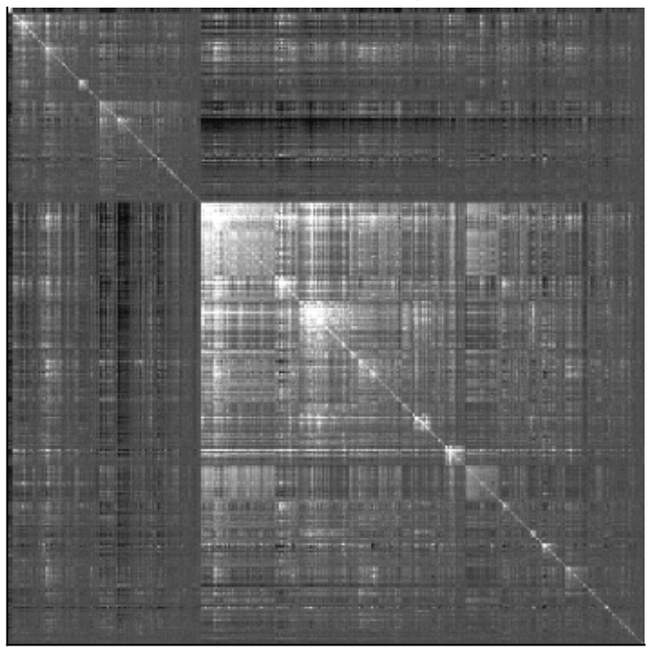

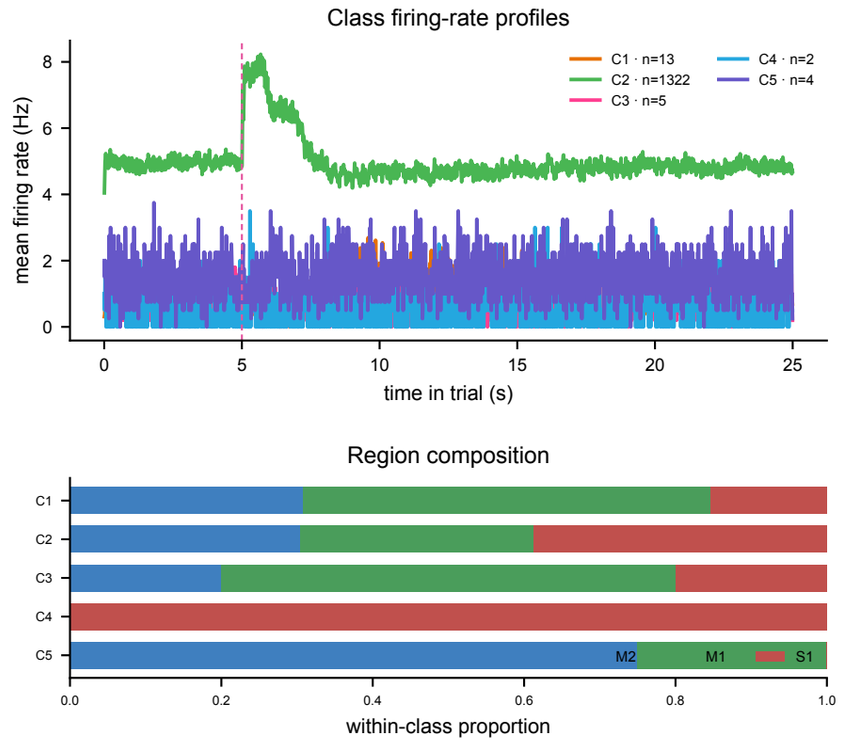

f

E, each unit vector concatenates all 80 unsmoothed 25-s single-trial spike-count traces. F, a centered five-bin smooth and separate within-trial z-score are applied before concatenation, reducing domination by firing-rate scale and between-trial offsets. Both panels preserve the complete original matrices, dendrograms, five-class summaries and regional compositions. Teacher-panel counts were used only as comparison targets, never to fit memberships.
