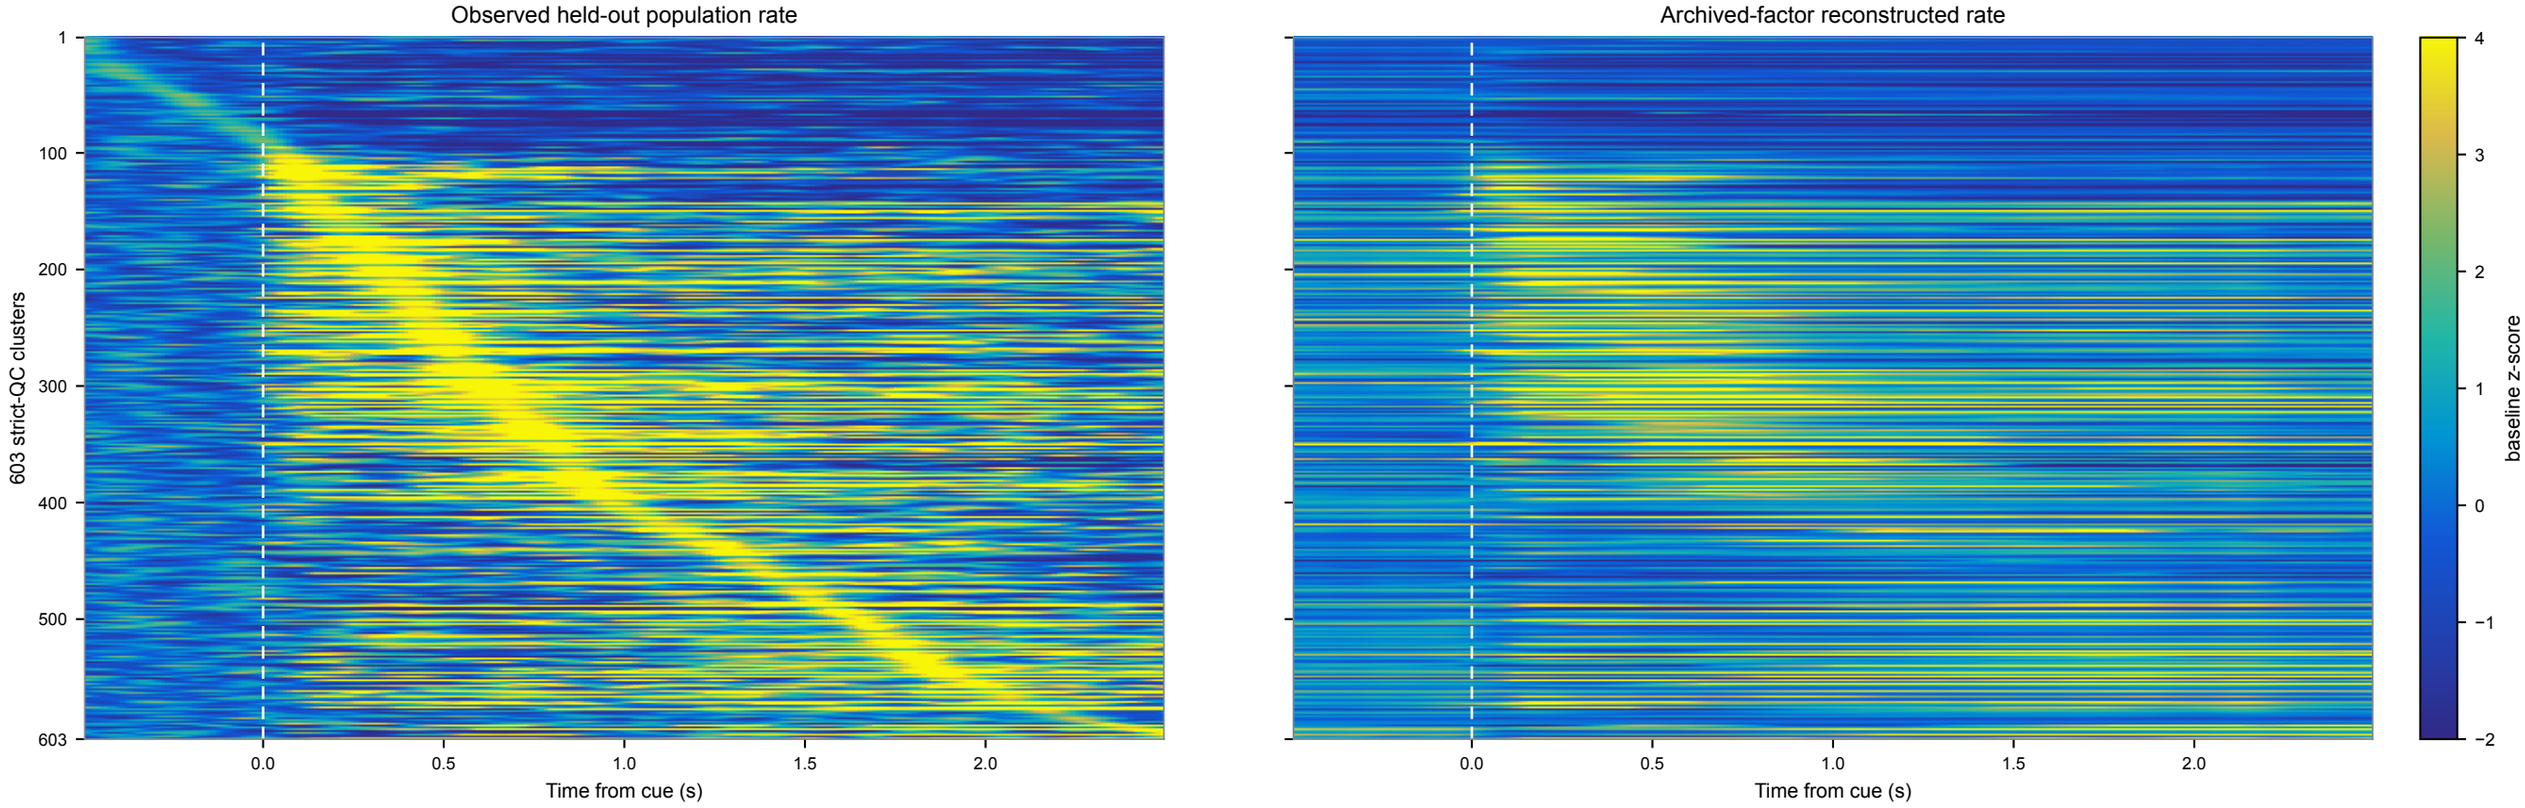

Figure 8a | Held-out observed and archived-factor reconstructed population activity

The same 603-neuron ordering, cue line and linear parula −2-to-+4 scale are used in both heatmaps.

a

Sixteen trials from one prespecified outer fold are averaged only for visualization. The ordering is determined from observed held-out activity and then frozen for the archived-factor reconstruction. Both panels use the observed pre-cue baseline mean and SD. This is a downstream reconstruction display from archived factors, not native LFADS test-set performance.
