Cue-response composition within waveform class

paired 80-trial test · BH-FDR classes · Fisher/Holm enrichment

Each waveform bar is normalized independently to 100%; brackets test whether fast/narrow neurons are more likely to be cue-excited.

One-sided Fisher exact tests compare cue-excited versus all other neurons; Holm correction covers the four displayed scopes. *** P<0.001, ** P<0.01, * P<0.05, ns P≥0.05. Neurons are not animals and waveform class is not a validated cell type.
