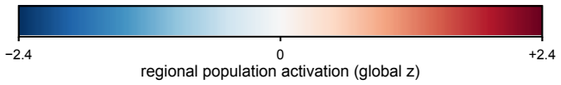

Figure 3b | Event-aligned regional population activation in success and failure trials

Columns are cue, reach, grasp and at-mouth; within each area, success and failure rows are adjacent. Every heatmap uses one shared z scale, and the trace below is trial mean ± SEM.

b

Cue | Reach onset | Grasp onset | At mouth

M1 Success — n=54 | n=54 | n=54 | n=49

M1 Failure — n=23 | n=23 | n=23 | n=14

M2 Success — n=54 | n=54 | n=54 | n=49

M2 Failure — n=23 | n=23 | n=23 | n=14

S1 Success — n=54 | n=54 | n=54 | n=49

S1 Failure — n=23 | n=23 | n=23 | n=14

Each row is one event-aligned trial from −1 to +2 s; trials lacking that event are excluded (at-mouth: success n=49, failure n=14). Regional signals are standardized across all trial-time samples. This is descriptive activation timing—not cross-area interaction, directionality or causal influence.
