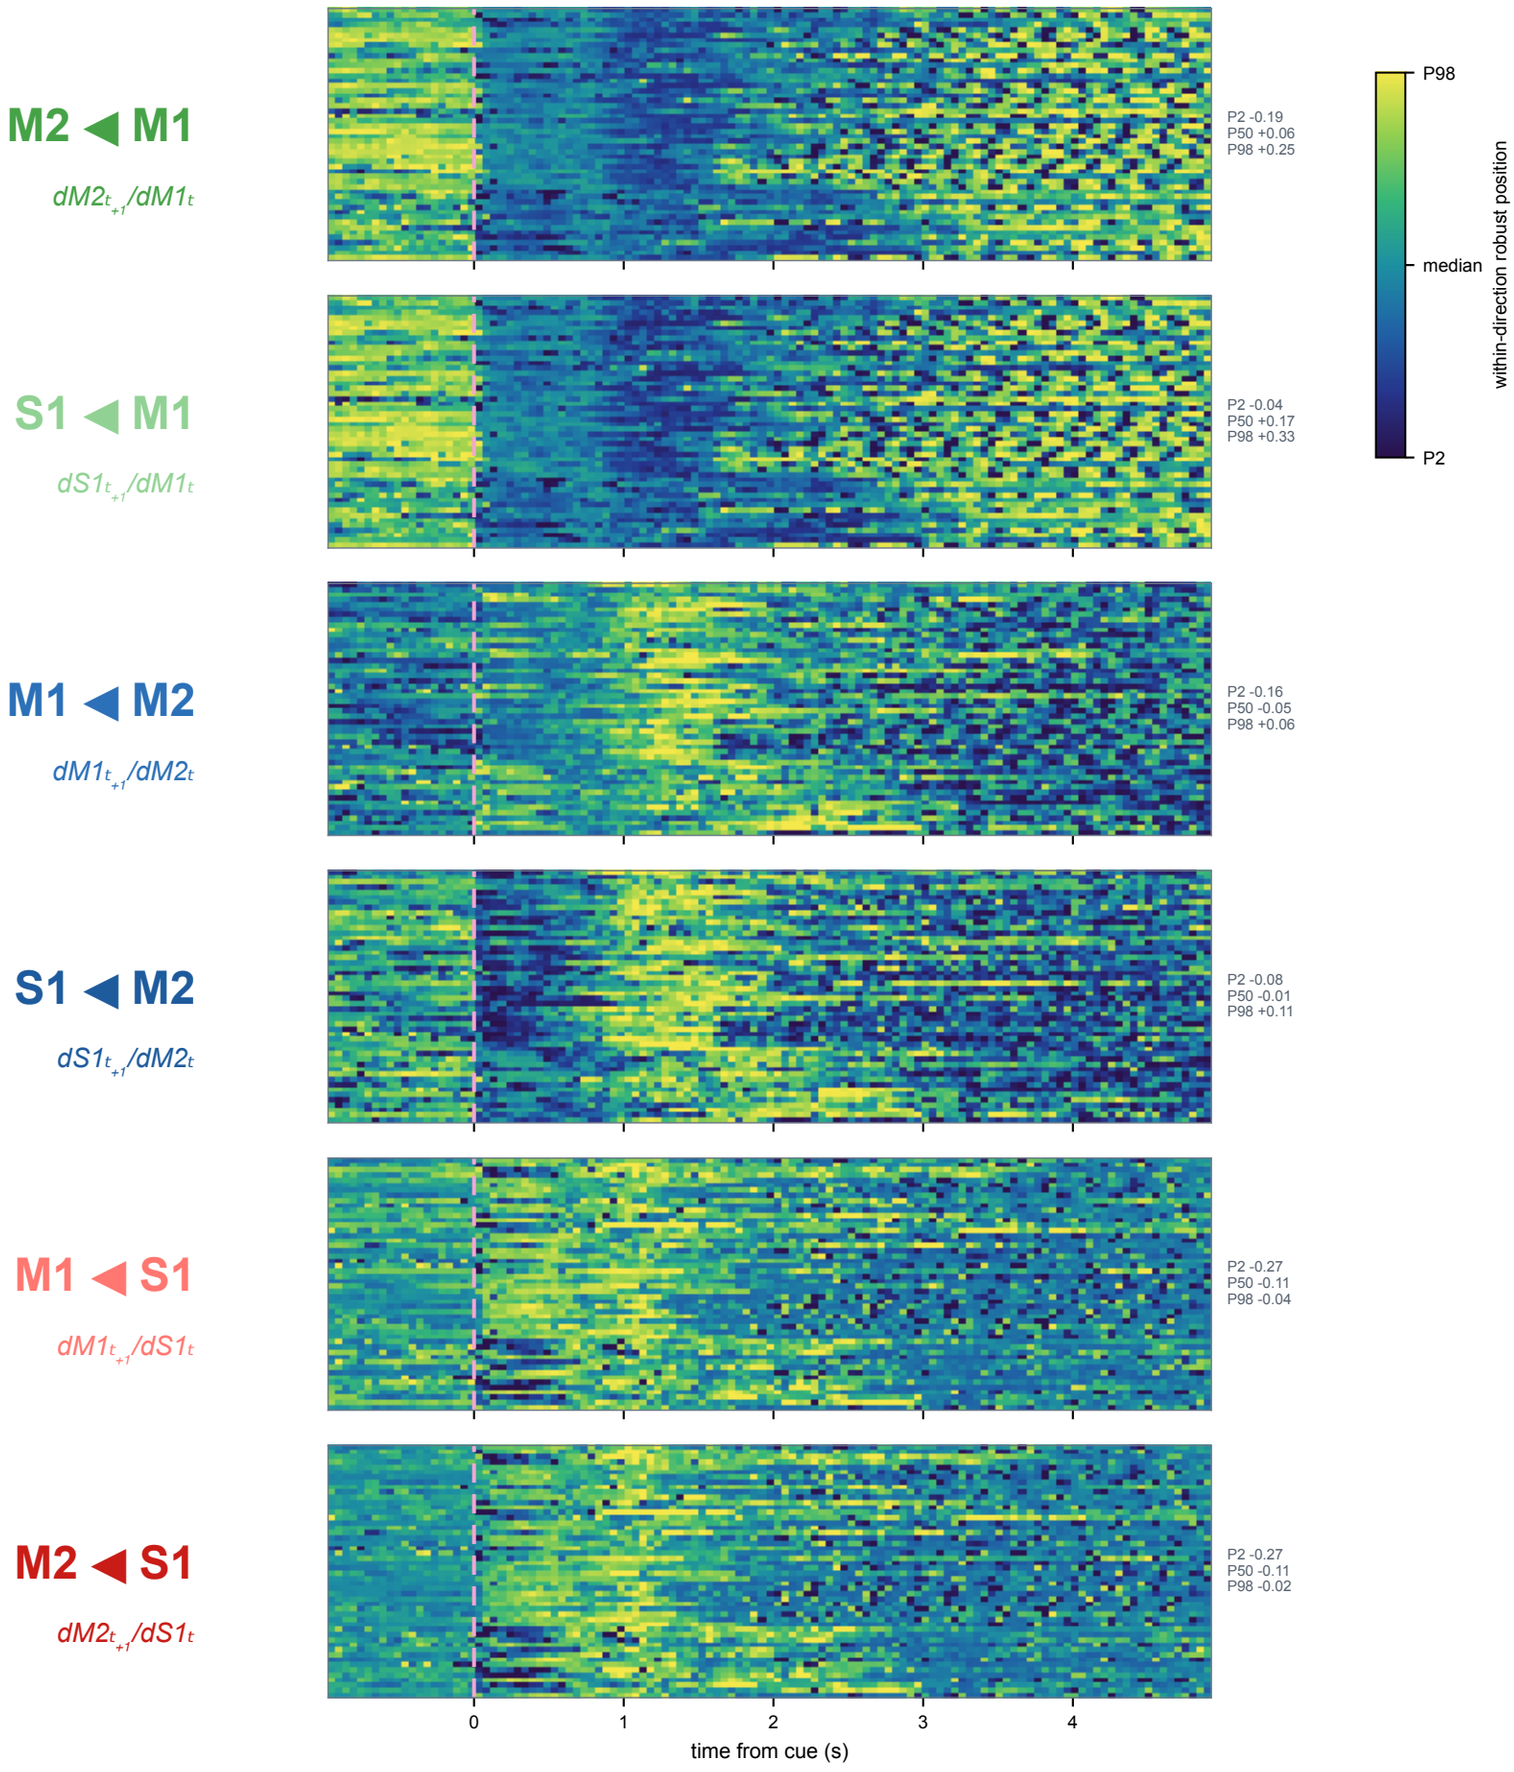

Figure 3c | Archived multivariate S-map across 50 trials

The exact archived coefficient cube is shown with a higher-contrast parula scale.
Each direction is normalized to its own P2–median–P98 range so trial/time structure remains visible; absolute ranges are printed at right.

c

Historical/full-data model: z-scored M1/M2/S1 regional activation and one-step 50-ms multivariate S-map; same-trial library points excluded; θ=4 selected by leave-one-trial-out forecast skill.
Direction-wise normalization changes color only, not coefficients, so colors cannot compare absolute magnitude across directions.
Slopes are predictive and non-causal; common task/movement structure was not removed.
